## NEW XP15W Wireless Self-Aligning Safebeam

### Features

- The transmitter is supplied with batteries (the receiver still needs to be connected with a cable like traditional photocells)
- Self-aligning mechanism
- 4 selectable transmission channels (enabling you to install up to 4 pairs of photocells on the same system)
- The transmitter can also be connected with a cable if you do not wish to use batteries.
- The battery supply on the transmitter allows for a quick installation time, and secondly, allows you to install the photocell in places that could not be reached with a wired solution.
- When supplied with batteries, the photocell just needs to be surface mounted or you can use the optional pivoting wall brackets or stands. The CR2 3V battery lasts between 2 to 3 years, depending on environmental/installation conditions.

### **NOTE:**

If the battery level is low, an LED on the receiver will warn you with rapid blinking. When the battery is completely discharged the gate will open and the receiver will go into a "safe" mode and will NOT enable the gate to close until the batteries have been replaced.

The maximum achievable distance between transmitter and receiver is 15m.
